Coming Attraction (optional): Preview Proof that the derivative of sin x is cos x ; bottom of page 209 to top of page 211 Due by Friday: Reflections on Unit Test 1b CHECKIN Friday DO NOW:

1) Find the following derivatives using the definition of the derivative;

(You may check your answer with the power rule)

$$f(x)=1/x \qquad (\frac{1}{X+h} - \frac{1}{X}) \times (x+h) \\ f'(x) = \lim_{h \to 0} \frac{(1+h)}{h} \times (x+h) \\ = \lim_{h \to 0} \frac{-1}{h} \times (x+h) \\ = \lim_{h \to 0} \frac{-1}{h} \times (x+h) \\ f'(a) = \lim_{h \to 0} \frac{(1-1)}{(1+1)} = \frac{-1}{x^2} \\ f'(a) = \lim_{h \to 0} \frac{(1-1)}{(1+1)} \times (x+h) \\ = \lim_{h \to 0} \frac{(1-1)}{(1+1)} \times (x+h) \\ = \lim_{h \to 0} \frac{x-h}{(1+1)} + \sqrt{a} \\ = \lim_{h \to 0} \frac{x-h}{(1+1)} + \sqrt{a} \\ = \frac{1}{2\sqrt{a}} = \frac{1}{2}a^{-\frac{1}{2}}$$

2) Use the power rule to find the second third, fourth, nth derivatives of f(x)=1/x ```(×)=

$$f^{(1)}(x) = \chi$$

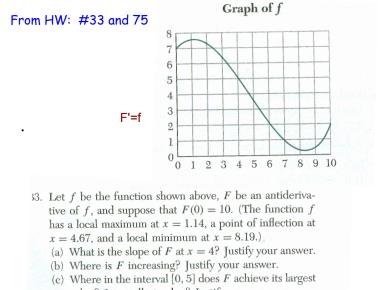

$$f^{(2)}(x) = -\chi^{-2}$$

$$f^{(3)}(x) = -6\chi^{-4}$$

$$f^{(4)}(x) = 24\chi^{-5}$$

$$f^{(4)}(x) = 24\chi^{-5}$$

$$f^{(4)}(x) = (-1)^{6}h^{\frac{1}{2}} \chi^{-(n+1)}$$

value? Its smallest value? Justify your answers.

What kind of functions can we now differentiate? Anything that is a power function or a multiple of a power function or a linear combination of multiples of power functions. What set of functions does this include?

Polynomials: Definition of polynomial:

(has a derivative)

Theorem: Every polynomial is differentiable for all real numbers x. The derivative of every polynomial is another polynomial.

$$\begin{array}{r}
\left(Q(x) = \chi^{2} + \chi + 3 \\
\frac{d(\chi^{2} + \chi + 3)}{d\chi} = 2\chi + 1 \\
\frac{d^{2}(\chi^{2} + \chi + 3)}{d\chi^{2}} = 2\chi + 1 \\
\frac{d^{2}(\chi^{2} + \chi + 3)}{d\chi^{2}} = 2\chi + 1 \\
\frac{d^{3}(\chi^{2} + \chi + 3)}{d\chi^{2}} = 2\chi + 1 \\
\frac{d^{3}(\chi^{2} + \chi + 3)}{d\chi^{2}} = 2\chi + 1 \\
\frac{d^{3}(\chi^{2} + \chi + 3)}{d\chi^{2}} = 2\chi + 1 \\
\frac{d^{3}(\chi^{2} + \chi + 3)}{d\chi^{2}} = 2\chi + 1 \\
\frac{d^{3}(\chi^{2} + \chi + 3)}{d\chi^{2}} = 2\chi + 1 \\
\frac{d^{3}(\chi^{2} + \chi + 3)}{d\chi^{2}} = 2\chi + 1 \\
\frac{d^{3}(\chi^{2} + \chi + 3)}{d\chi^{2}} = 2\chi + 1 \\
\frac{d^{3}(\chi^{2} + \chi + 3)}{d\chi^{2}} = 2\chi + 1 \\
\frac{d^{3}(\chi^{2} + \chi + 3)}{d\chi^{2}} = 2\chi + 1 \\
\frac{d^{3}(\chi^{2} + \chi + 3)}{d\chi^{2}} = 2\chi + 1 \\
\frac{d^{3}(\chi^{2} + \chi + 3)}{d\chi^{2}} = 2\chi + 1 \\
\frac{d^{3}(\chi^{2} + \chi + 3)}{d\chi^{2}} = 2\chi + 1 \\
\frac{d^{3}(\chi^{2} + \chi + 3)}{d\chi^{2}} = 2\chi + 1 \\

\frac{d^{3}(\chi^{2} + \chi + 3)}{d\chi^{2}} = 2\chi + 1 \\
\frac{d^{3}(\chi^{2} + \chi + 3)}{d\chi^{2}} = 2\chi + 1 \\
\frac{d^{3}(\chi^{2} + \chi + 3)}{d\chi^{2}} = 2\chi + 1 \\
\frac{d^{3}(\chi^{2} + \chi + 3)}{d\chi^{2}} = 2\chi + 1 \\
\frac{d^{3}(\chi^{2} + \chi + 3)}{d\chi^{2}} = 2\chi + 1 \\
\frac{d^{3}(\chi^{2} + \chi + 3)}{d\chi^{2}} = 2\chi + 1 \\
\frac{d^{3}(\chi^{2} + \chi + 3)}{d\chi^{2}} = 2\chi + 1 \\
\frac{d^{3}(\chi^{2} + \chi + 3)}{d\chi^{2}} = 2\chi + 1 \\
\frac{d^{3}(\chi^{2} + \chi + 3)}{d\chi^{2}} = 2\chi + 1 \\
\frac{d^{3}(\chi^{2} + \chi + 3)}{d\chi^{2}} = 2\chi + 1 \\
\frac{d^{3}(\chi^{2} + \chi + 3)}{d\chi^{2}} = 2\chi + 1 \\
\frac{d^{3}(\chi^{2} + \chi + 3)}{d\chi^{2}} = 2\chi + 1 \\
\frac{d^{3}(\chi^{2} + \chi + 3)}{d\chi^{2}} = 2\chi + 1 \\
\frac{d^{3}(\chi^{2} + \chi + 3)}{d\chi^{2}} = 2\chi + 1 \\
\frac{d^{3}(\chi^{2} + \chi + 3)}{d\chi^{2}} = 2\chi + 1 \\
\frac{d^{3}(\chi^{2} + \chi + 3)}{\chi^{3}} = 2\chi + 1 \\
\frac{d^{3}(\chi^{2} + \chi + 3)}{\chi^{3}} = 2\chi + 1$$

There are two different notations used for derivatives, the one we have been using is Newton's notation. We also need to be familiar with Leibniz notation and will use it

occasionally. Assume y=f(x), then we write:

$$\frac{dy}{dx} = f'(x) \qquad \frac{dy}{dx}\Big|_{x=a} = f'(a)$$

Read this: derivative of y with respect to x

Read this: derivative of y with respect to x at x=a

$$\frac{d}{dx}\left(\frac{dy}{dx}\right) =$$
 If we differentiate with respect to x again:
$$\frac{d^2y}{dx^2} = f''(x)$$
$$d^n Y = g(n) \langle x \rangle$$

$$\frac{d^{n}y}{dx^{n}} = f^{(n)}(x)$$

A little more about Continuity Recall that we learned:

There is Algebra with Limits Suppose that $\lim_{x\to a} f(x) = L$ and $\lim_{x\to a} g(x) = M$ Need to do

where L and M are finite numbers (a is not necessarily finite). Let k be any constant. Then the following limits all exist and are given by:

and we got all combinations $(+ - x \div)$ of limits to exist and do what we'd expect.

Also, remember the definition of continuity is

 $\lim_{x \to a} f(x) = f(a)$

We then have: Algebra of Continuity: If f and g are both continuous at x=a, then each of the functions f+g f-g fg are also continuous at x=a. If $q(a)\neq 0$, then f/g is also continuous at x=a. We even get information about composition and continuity:

FACT: If f and g are functions such that $\lim_{x \to a} g(x) = b$ and f is continuous at x=b, then $\lim_{x \to a} (f \circ g)(x) = \lim_{x \to a} f(g(x)) = f(b)$

Theorem: Suppose that g is continuous at x=a and f is continuous at g(a). Then $f \circ g$ is continuous at x=a

Applications: Suppose we wanted to know:

 $\lim_{x \to 0} \ln \left(\frac{\sin x}{x} \right)$

Need to do

 $\lim_{x\to 0} \ln(\cos x)$
